

How Influencer Butler Works

The Chrome extension: scores, data sources and estimates. A quick reference to keep next to you while you explore.

CHROME EXTENSION

REFERENCE GUIDE

AT A GLANCE

It adds a money layer to the page you are already on

On Amazon and Walmart search results and product pages, the Butler shows what a product could earn you and whether it is worth making content for, so you can decide in seconds instead of clicking into every listing.

1. READ

The page

Price, deals, ratings, reviews and Amazon's own "bought in past month" are read straight off the page you are viewing.

2. LOOK UP

Rates and demand

Commission rates, campaign rates, stock, video counts and sales rank come from product pages, rate cards and our shared catalogue.

3. SCORE

0 to 100

Six signals blend into one Butler Score, so results can be ranked the way a creator would weigh them.

THE BUTLER SCORE

How the 0 to 100 number is built

Six signals, weighted by what actually decides whether a video earns. The points always add up to the score you see.

Commission

earned per sale

30

Open video slot

how crowded it is

25

Demand

is it selling now

20

In stock

can people buy it

10

Campaign

bonus if one exists

10

Price

worth the effort

5

70+

HOT PICK

40 to 69

WORTH A LOOK

Under 40

LOW PRIORITY

How each signal is judged

- **Commission:** dollars per sale. Full points at \$5 or more, scaling down below that.
- **Open slot:** fewer existing influencer videos scores higher. At six or more, this part drops to zero.
- **Demand:** Amazon's "bought in past month". Full points at 200 or more.
- **Price:** full points at \$20 or more.

Not known yet? No penalty.

If a signal has not loaded (for example video counts on a search tile), it gets **half credit** instead of dragging the score down. Open the product or tap **Scan videos** and the score sharpens.

Example: a \$299.99 laptop at a 2.5% rate scores 83: commission 30 + open slot 12.5 (not scanned) + demand 20 + stock 5 (not checked yet) + price 5 + campaign 10.

BUTLER APPROVED

The pass or fail check behind "Approved" and "Likely fit"

Same signals as the score, as a simple checklist you can tune in the extension settings.

ALL FOUR PASS

Butler Approved

- Selling now: 50 or more bought in the past month
- Open slot: 5 or fewer influencer videos
- In stock
- Price at least \$20

THREE PASS, VIDEO COUNT UNKNOWN

Likely fit

Everything we can see is a pass, but the video count has not loaded yet. Open the product page or scan videos to confirm it. Any failed check removes the badge instead of guessing.

CHIP GLOSSARY

What each chip on a search result means

CHIP	WHAT IT TELLS YOU	HOW IT IS WORKED OUT
83	Butler Score	Weighted blend of six signals (page 1).
\$7.50/sale	Your estimated commission per sale	Price × your commission rate. Rate comes from your live SiteStripe rate, else the Associates rate card for the category, else your saved default.
~1,000 units/mo	Estimated sales per month	Amazon's "bought in past month" when shown, otherwise modeled from the product's sales rank.
~\$300K/mo	Estimated revenue for the product	Estimated units × price. This is the product's revenue, not what you would earn.
#5 Laptops	Best Sellers Rank	Read from the product page.
Campaign 10%	A paid campaign exists	Creator Connections rate once it loads. Sponsored Products shows Amazon's own per-click forecast.
Deal -43%	A real price drop	Current price vs the was or list price, shown for cuts of 10% or more. "Typical price" references are not counted as deals.
Prime Day	Event deal	Read from Amazon's own deal badge (Prime Day, Lightning).
Earned \$42	You have earned on this before	From your own order and earnings history in the desktop app.
★ Watch	Get alerts	Notifies you when it is back in stock, a video slot opens, or the price drops (Amazon).
...	More actions	Add to a list, copy a tracked link, open the page, schedule a post.

PUTTING IT TO WORK

A quick way to pick what to film

- 1 Sort by **Butler Score** using the toolbar above the results. Hot picks (70+) rise to the top.
- 2 Look for **Butler Approved** or **Likely fit**. These are selling now, in stock and not crowded with other creators.
- 3 Check the **money chips**: commission per sale, a Campaign chip for boosted pay, and Deal chips for real price drops.
- 4 Open the **product** to confirm the video count, or tap **Scan videos** to check a whole page at once. The score sharpens as data loads.

Tip: hover the estimate chips for a plain-English note, and re-pick a sort in the toolbar after details load to apply the updated scores.

DATA SOURCES

Where each number comes from

Two kinds of numbers: **READ** straight off the page, and **ESTIMATED** from our models and shared catalogue. Estimated sales and revenue always carry a "~".

AMAZON

READ

From the page: price, was price, deal and coupon badges, star rating, review count, "bought in past month", sponsored label.

READ

From each product page: in stock, number of influencer videos, Best Sellers Rank, category. Loaded in your own browser for the results you scroll to, or on demand.

RATE

Commission: your live SiteStripe rate, else the Amazon Associates rate card for the category, else your default.

RATE

Campaigns: Creator Connections rates and end dates, refreshed daily, plus Amazon's own Sponsored Products forecast.

EST.

Sales and revenue: see "How estimates are calculated" below.

YOURS

Earnings, orders, "already posted": from your own desktop app, over a connection on your own computer. Shown only when the app is connected.

WALMART

READ

From the page: price, was price, Rollback, Clearance and Reduced price badges, rating, review count.

READ

Product pages: price, stock and category from the page's own data.

RATE

Commission: Walmart's published affiliate category rates. Search results do not show a category, so tiles use the base rate (about 1%). Product pages use the category.

EST.

Sales and revenue: shown only when the shared catalogue has data for the item. Walmart coverage is still growing.

NOTE

Video slots are an Amazon concept, so Walmart scores lean on commission, price and deal signals.

ESTIMATES

How estimates are calculated

Estimated sales per month

- 1 Amazon's own number first.** When a listing shows "400+ bought in past month", that is used as a floor.
- 2 Shared catalogue.** Otherwise a sales estimate from sales rank, fitted per category using products where we can see both rank and Amazon's bought figure.
- 3 Built-in rank model** as the final fallback, adjusted by category.

Revenue is estimated units × price.

Your commission per sale

- 1 Live SiteStripe rate** when you are signed in and it is on the page.
- 2 Associates rate card** for the product's category (Walmart: its published category rates).
- 3 Your saved default rate** from extension settings.

A confirmed Creator Connections rate replaces the standard rate for that product.

FRESHNESS

How current is it?

WHAT	HOW OFTEN IT UPDATES
Page values	Live as you browse: price, deals, rating, reviews, bought count.
Product page details	Stock, video counts and rank are reused for up to a day so scrolling stays fast.
Commission and campaign rates	Refreshed about once a day.

GOOD TO KNOW

Reading the numbers well

- **Sales and revenue are estimates.** A "~" means modeled, not reported by Amazon or Walmart.
- **"400+ bought" is a floor,** so the real number is at least that.
- **Revenue is the product's total,** not your earnings. Your earnings are the sales you drive times your rate.
- **Commission is an estimate.** Associates rates vary by category and country, and special campaigns can pay more.
- **Data refreshes as you browse.** Rates and product details are reused for up to a day.
- **Other countries:** Global reach shows "not checked" until the Creator API is connected, instead of guessing.
- **Sites change.** When Amazon or Walmart redesign a page, we ship a fix quickly.

FAQ

Quick answers

Why does a high score say "Likely fit" and not "Approved"?

The video count has not loaded for that result. Open the product or tap Scan videos and it resolves to Approved or removes the badge.

Why do some results have no chips?

Sponsored ad carousels and non-product blocks are not scored. Regular product results are.

Can I change the thresholds?

Yes. In the extension settings you can set the minimum bought count, maximum influencer videos, minimum price and your default commission rate.

Do I need the desktop app?

No. The scoring, chips and sorting work without it. The app adds your earnings, "already posted" markers and one-click sending to your butlers.

Is the estimated revenue what I will make?

No. It is the product's estimated revenue. Your earnings depend on the sales you drive and your commission rate.

Is the extension free?

Yes, the extension is free to install.

GLOSSARY

Terms you will see

- **SiteStripe:** Amazon's Associates toolbar at the top of Amazon pages. It shows your live commission rate.
- **Creator Connections:** Amazon's program where brands offer boosted commission on specific products.
- **Sponsored Products for Creators:** a pay-per-click campaign type. The Butler shows Amazon's own per-click forecast.
- **Best Sellers Rank:** Amazon's sales rank within a category. A lower number means more sales.
- **Open slot:** room for a new creator video, judged by how many influencer videos a product already has.
- **Rollback and Clearance:** Walmart's markers for reduced prices.

PRIVACY

Your data stays yours

- **Reads pages in your browser.** No account is needed for the core tools.
- **Optional sync** sends your own findings to your dashboard, only if you turn it on.
- **Shared catalogue contribution is off by default.** If you turn it on, only product facts (price, rank, category, bought count) are pooled, never personal data.
- **Desktop app link** stays on your own computer.

WHERE IT WORKS

12 Amazon storefronts (US, CA, UK, AU, DE, FR, IT, ES, JP, IN, MX, BR) and **Walmart.com** (US). Non-English wording is best-effort.
